

Dear Customer,

With holiday season behind us, you may have noticed that your old electric water heater perhaps let you down with all the friends and family visiting, more dishes to clean and more clothes to wash. You never seemed to have enough hot water.

If you are thinking of replacing your electric water heater, consider replacing it with a propane water heater. Here's why a propane water heater makes so much sense:

- Propane heats water twice as fast as electricity, which means you will have a lot more hot water for everyone and everything.
- More than 20% of your home's energy costs are spent heating water. A propane water heater being more efficient than an electric one will save you money.
- Many propane water heaters do not need electricity to operate, so you can have hot water even when the power goes out.
- Propane tankless water heaters can save you even more money and provide you with endless hot water.

And if those are not enough reasons to switch to a propane water heater, **we are currently offering a \$200 rebate if you switch from an electric water heater to a propane tank water heater or a \$300 rebate if you switch from electric to a tankless water heater.** (Note that there are federal tax credits of up to \$300 you may be eligible for when installing a tankless propane water heater on top of the rebates we are offering.)

Please give us a call and we can give you more details on how you can qualify for the rebates mentioned above.

Sincerely,

Mark Dmochowski
